INSTALLATION

ASSEMBLING

Assembling should be done as follows:

1. Bolt legs to the cabinet (use special bolts in coin box).
2. Gently extract electric cable and place in the proper cavity, checking that non-skid knot is there.
3. Remove the elastic strip that secures the light board and lift it to a vertical position. During this operation make sure that the cable is not crushed between the parts. The light board has an automatic coupling that keeps it in a vertical position, to ease the fitting of the 4 bolts with the relevant washers, that can be found in the coin box too.

VISUAL INSPECTIONS

On all games there are certain points that should be always checked after transport. Some are visual inspections which may be helpful to avoid some time consuming service work later. Minor damages caused by rough handling during the transport are practically unavoidable. Cable connectors may be loosened, switches (especially tilt switches) may lose their proper adjustment. Especially the plumb bob tilt switch should always be adjusted after game is set on location.

1. Check whether cabinet cable is connected to the light board cable.
2. Check for any wires that may have become disconnected.
3. Make sure that the cables do not obstacle the moving parts.
4. Check that all fuses are making good contact.
5. Check whether the transformer is connected for the proper main voltage.
6. Check and adjust the sensitivity of tilt contacts as follows.
 - A. Plumb bob tilt switch.
Adjust the plumb bob tilt length according to the required sensitivity.
 - B. Rail tilt and ball.
Put the ball into the rail and check whether it moves properly and closes the contact when the cabinet is raised.
 - C. Shockproof tilt
There are two:
The first one near plumb bob tilt, the second one near coin chutes. Adjust contact distance to desired sensitivity.

GENERAL GAME OPERATION

1. Put one the ball into the bottom hole
Connect voltage and start the game.
2. The «GAME OVER» lamp is lit (if the TILT lamp lights up, check the sensitivity of the normally open tilt contacts).
3. Check whether the machine accepts properly the coins and increments the relevant credits. Please keep in mind that the machine shall not accept any coins when turned off or if the number of credits has reached the max. programmed amount.
4. If after having started the game the GAME OVER lamp is lit, it is necessary to carry out some control functions, because the data stored in the battery memory, are not valid anymore. If the game has been disconnected for many weeks, this is very likely to happen.
If on the other hand the machine has been recently used, and the GAME OVER lamp blinks, it is possible that the battery or its reloading circuit are out of order.
In any case, before starting the machine it is advisable to reprogram it.
5. Act on credit push-button. The «GAME OVER» lamp shall extinguish.
 - A. First player lamp shall be lit.
 - B. The credits are decreased by one.
 - C. «BALLS TO PLAY» lamp shall be lit.
 - D. The playfield is ready and the ball is ejected from the hole.
6. Each time the credit push-button is operated, the number of credits is decreased by one and the number of players is updated.
7. The max. number of credits available is four.

The purpose of this chapter is to give a general line to follow, so as to maintain the machine in proper operation. The operations shown have to be carried out each time one operates on the machine, even when on power-up.

1. Carefully check that securing screws of electronic boards do not work loose as well as all connectors of the plate.
 - Check and if necessary tighten the screws of the rubber post.
 - Check the conditions of the rubber rings and if necessary change them (remember to check the adjustment of contacts each time the rubber rings are replaced).
 - Carefully clean playfield. Do not use highly caustic cleaners.
2. Playfield (lower part).
 - Check flipper assembly (tie rod, pin joints and contacts).
 - Check bumpers.
 - Check contact adjustments.
 - Check wiring harness to avoid stresses on the wires and obstacles to the moving parts.
3. Check and adjust tilt sensitivity.
Remember: an efficient periodic maintenance greatly improves the pintable lifetime and avoids the possibility of damages.

NOTE

Games are factory programmed, according to the special requirements of their designation. The main programming elements may be changed, however, by following procedures below.
We remind you that these procedures shall be performed EXCLUSIVELY by skilled technicians, because wrong programming could cause malfunctions.

GENERAL TECHNICAL INFORMATION

To avoid that any cause (battery discharged or others) causes the loss of the data stored in RAM C-MOS, and thus the failure of the pintable, the basic program contains some typical programmings (to replace the switches that had been used with the precedent series).

When the microcomputer notes that the programming data of RAM C-MOS do not apply anymore, recall one of the 6 lists of typical programming (see table I).

For the CHOICE OF THE TYPICAL LIST, that will be called in case of necessity, the DIP SWS. 1, 2 and 3 are used, that are mounted on the C.P.U. board (see figure 1).

On the sound board there are 2 trimmers provided for the separate tuning of the max. volume of sounds and talking.

For the final tuning of the loud-speaker volume, both for sound and for talk, there is a potentiometer provided, that is located inside the cabinet on the right side of the door. At the front board of the cabinet there is a plug for the headset, whose volume shall be adjusted on the headset itself (see figure 3).

To operate on the «TESTS» with the pintable in GAME OVER position, on the door there is an «ADVANCE-RETURN» switch with central rest position (or 2 push-buttons, of which one «ADVANCE» and the other one «RETURN»). By acting on «ADVANCE» at each control the tests progress 1 by 1 from 0 through 37 and then again 0, 1, 2 etc. When pushing again «RETURN», each time the test number is decreased by one (contrary to what happens with «ADVANCE»).

The test number is indicated on the 2 figures of the «BALLS TO PLAY» display (see fig. 2). To leave the test, and return thus to GAME OVER, it is sufficient to stop and then start again the game, or to push ADVANCE or RETURN until the display shows 00.

To clear the «accounting» tests or in any case to amend the programming tests, it is necessary that SW n. 4 on the C.P.U.-board (see fig. 1) points to ON (PROGRAM), and then call the test to be changed, and act on the «CREDIT» push-button. After having cleared or programmed the test, to return in GAME OVER condition and thus to be able to play, call test 00 and then put SW n. 4 in OGG (GAME) position.

If the SW n. 4 has not been reset, and you are still in ON (PROGRAM) condition with the 00 (GAME OVER) test, there will be a buzzing sound and the TILT lamp will be blinking, to inform on the anomalous condition that doesn't allow to use the game.

IMPORTANT: each time the battery or RAM C-MOS 6514-9 are replaced, or in any case of interruption of the memory feeding, it is necessary to act as follows to enter the new program:

- a) Clear the accounting tests (5, 7, 8, 9) even if they apparently are already cleared.
- b) Program the tests from 10 through 37, without forgetting to program also those tests that apparently are already programmed.
For example, if you wish to program the test 10 with 00, and on the display 00 has already appeared, then push the CREDIT push-button until 00 appears again.

Once the programming has been terminated, the GAME OVER LAMP shall remain lit.

If it is blinking this means that the programming has not been accepted, and thus it has to be repeated in the proper way.

Now we are going to analyse the technical performances in a detailed manner, starting with the self-test function, followed by the accounting functions and eventually the various programming functions.

SELF TEST

DISPLAY (Test n. 1). By this we check optically the proper operation of the display (5 groups of 7 figures each covering a total of 35 figures). The 5 groups are the the following: **1st player display; 2nd player display; 3rd player display; 4th player display; HIGHEST SCORE TO DATE display or DISPLAY CREDIT, TIME BONUS and BALLS TO PLAY.** When this test is entered, all the figures show the same numbers, starting with «0» that immediately becomes «1» then «2» and so on until «9»; then they restart at «0» and so on. By acting on CREDIT push-button the 7 figures of each display indicate 7 numbers in continuous succession.
Example: 6 5 4 3 2 1 0
7 6 5 4 3 2 1

CONTACTS (Test n. 2). By this test function it is possible to check the proper operation of the 64 INPUT contacts numbered from 00 through 64. When this test is entered, on the 2 figures of the CREDIT display appears the "closed" contact highest in number, and after having opened it, follows the number of the closed contact next in order. If none of the 64 contacts is "closed" no number is indicated. Under these circumstances it is possible to check whether all the contacts work properly, by closing them one by one and making sure that each time the corresponding number appears on the special display provided. For the numbering of contacts see fig. 4 N.B. The presence of the ball in the lower hole or the mobile plate in down position respectively keep the contacts 16 and 5 closed. To avoid their interference with the test functions, we recommend to enter the solenoid test to have the plate going up and to remove the possible ball in the lower hole.

LAMPS (Test n. 3). All the «piloted» lamps, that have been divided into two groups, are lit and extinguished alternatively at regular intervals. Check whether there are any lamps that are not operative.

SOLENOIDS (Test n. 4). All the solenoids (coils) are energized in sequence from 1 through 24. The number of the energized solenoid appears on the CREDIT display in that very moment.
NOTE THAT EACH SINGLE PINTABLE MODEL MAY USE ONLY PART OF THE 24 AVAILABLE SOLENOIDS.
In the test all the solenoids are treated in the same way (either used or not), and thus on the CREDIT display the numbers of all the 24 possible solenoids are indicated. Those that are not operative and are missing do not cause any effect (mechanical noise).
The number of employed solenoids is indicated on fig. 6.

SOUND AND TALKING (Test n. 5). This test serves to hear the various sounds and phrases programmed for the model and to check whether they are correct; in the same time on the CREDIT display appears the number of the sound or of the phrase being executed.
To check the proper operation of the SOUND board, use the special self-test program, that is on the board itself (see paragraph self-test sound and talking board).

ACCOUNTING FUNCTIONS

TIME (Test n. 6). Same contains the accounting data relevant to the time (minutes) of pintable operation (1st player display), to the actual duration of the game (minutes) (2nd player display), the number of TILTS (3rd player display) and to the average duration of games (4th player display). The average duration of games is expressed in minutes, and is determined by the ratio between the play time and the number of games that have been played.
The above accounting functions can be cleared simultaneously, by keeping pressed the CREDIT push-button for about 5 seconds, provided SW n. 4 on the C.P.U. board is on ON (PROGRAM).

TAKINGS (Test n. 7). The number of coins collected by the first coin chute (on the left side) is indicated on the 1st player display. The number of coins collected by the second coin chute (on the right side) is shown on 2nd player display. The 3rd player display accounts for the number of coins introduced into the third coin chute (the central one). On the 4th player display the number of «service» games is reported, that is those games obtained by pressing the «SERVICE» push-button that is located inside the door on the left side.
NOTE THAT THE «SERVICE» PUSH-BUTTON DOES NOT CHANGE THE NUMBER OF CREDITS, BECAUSE IT ENTERS DIRECTLY FROM 1 THROUGH 4 GAMES, AND ALSO THE ELECTROMECHANICAL COIN COUNTS IS NOT AFFECTED.
To clear it, SW n. 4 on the C.P.U. board (see figure 1) shall be in position ON (PROGRAM), and then act on the CREDIT push-button for about 5 seconds.

WINNINGS (Test n. 8 and 9). Test n. 8 indicates the winnings listed per types, that is: on the 1st player is indicated the overall quantity of games that have been played (the addition of the paid games, the won ones and the SERVICE games).
On the 2nd player display appear the won games.
On the 3rd player display one can see the number of won balls. Finally the 4th player display shows the quantity of awarded SUPERBONUSES.
— The test n. 9 shows how the winnings have been obtained.
The 1st player display indicates how many times the HIGHEST SCORE has been exceeded (NORMAL if test 10 is programmed with 00, RANDOM if test 10 is programmed with 01).
The 2nd player display shows the number of winnings obtained with winning scores.
The 3rd player display shows the number of winnings obtained with SPECIAL 1. Finally, on the 4th player display appears the number of winnings obtained with SPECIAL 2.
To clear the winnings, SW n. 4 shall be in position ON (PROGRAM); then enter test n. 8 and act on the CREDIT push-button for about 5 seconds; then enter test n. 9 and again press the CREDIT push-button for about 5 seconds.

COINS (Tests n. 11, 12, 13, 14, 15, 16). To meet the requirements due to the various types and values of coins used in the different countries, a highly sophisticated method for programming the cost of one «credit» (one game) has been adopted. The main features of this method are:

- a) the possibility of giving one credit with several coins,
 - b) same number of allowances if the value of the introduced coins is the same, regardless of their number and type,
 - c) the possibility of establishing a cost per credit that differs from the value of the various coins.
- To achieve proper programming of the cost of one credit, when allowances shall be granted, it is necessary to keep in mind that the cost ratio between the more expensive credit and the less expensive one shall be less than «2».
- The tests 11, 13 and 15 shall be given the unit «value» of the coins that can be introduced respectively into coin chute n. 1 (on the left side), coin chute n. 2 (on the right side) and coin chute n. 3 (in the middle).
- Do not forget that the coins shall be introduced into the 3 coin chutes in **GROWING ORDER**. The coin with the lowest value shall be introduced into the first coin chute, to the second coin chute can be assigned a coin of the same or higher value than the first one.
- The third coin chute shall receive the coin that has or higher or at least the same value as the coin introduced into the second coin chute.
- The tests, 12, 14 and 16 shall be programmed with the number of credits to be given to each coin introduced respectively into coin chutes 1, 2 and 3.
- If several coins are needed to get one credit, it is necessary to program 00.
- The coin attributed to the third coin chute, shall have the same or higher value than the cost of one credit. (The figure to be programmed on test n. 16 shall be equal to or higher than 1).
- THE UNIT VALUE OF COINS IS THE FIGURE OBTAINED BY DIVIDING THE ACTUAL VALUE OF THE COINS BY THE MAX. COMMON DIVISOR.**

Example: 10 p; 50 p; 10 = 1+5
 100 L; 200 L; 500 L = 1+2+5

As a further guidance for the operators on Table II some actual coin chute programming examples are reported, that are used for some European countries.

HIGHEST SCORE (Tests n. 10, 17 and 25). There exists the possibility to choose among 2 different types of H.S.: **NORMAL** (Test 10 = 00) and **RANDOM** (Test 10 = 01). **NORMAL H.S.** represents the max. score value achieved by one player. When this score is exceeded by one or more players, it is replaced by the score obtained by the player who has totalled the highest score. The players that follow shall exceed the new H.S. value to have their winning score recorded.

RANDOM H.S., on the contrary consists of a casual score, ranging within an area of 12.000.000 points, that is set forth at the beginning of each game.

The minimum value is given by the figure programmed with test 17, and that can range from 0.000.000 through 9.990.000.

The same test is used to program a **NORMAL H.S.** at the beginning, when the pinball is installed, or in any case to clear or change the existing H.S. value. To do so, press several times the **CREDIT** push-button, if slow progressing is required, otherwise keep it pressed for fast progress. To change the initial value of **Random H.S.** it is necessary that SW4 on the C.P.U. board is in **ON (PROGRAM)** position, while it may be both on **ON (PROGRAM)** or **OFF (GAME)** to change the initial value of **NORMAL H.S.**

The player who exceeds the **NORMAL** or **RANDOM H.S.** wins the prize established by the programming of test n. 25, with the following possibilities:

- Test 25 = 00 = no win
- 01 = 1 replay
- 02 = 2 replays
- 03 = 3 replays
- 04 = 1 superbonus

Both test 10 and test 25 require SW n. 4 to be in **ON (PROGRAM)** position to change their programming, and then it is necessary to press the **CREDIT** push-button.

FOR NORMAL H.S., THE WIN IS AWARDED ONLY TO THE PLAYER WHO OBTAINS THE HIGHEST SCORE, EVEN WHEN THE PLAYERS EXCEEDING THE PRESET HIGHEST SCORE VALUE ARE MORE THAN ONE.
IN THE CASE OF RANDOM H.S. THE WIN IS GIVEN TO ALL THE PLAYERS WHO EXCEED THE PRESET H.S. VALUE.

MAX CREDIT (Test n. 19). Same represents the max. number of credits that can be recorded before the coin chute locking mechanism is released, thus preventing further introduction of coins. Same represents also the figure beyond which the credits are not increased anymore because of any won games. It is programmable from 10 through 30 by acting on the **CREDIT** push-button, provided SW4 is set on **ON (RANDOM)**.

BALLS (Test n. 20). Same represents the number of balls that are available during each game. It can be programmed from 01 through 02 by acting on the **CREDIT** push-button while SW4 shall be on **ON**.

MATCH (Test n. 20). Match is the possibility to award one replay to the player or to the players, who have managed to get a score on their display the two right end figures correspond to those of **MATCH** (see figure 2). If it is programmed with 00, it is excluded, while if the programmed figure is 01, it is connected. To change the programming act on the **CREDIT** push-button. SW n.4 shall be set **ON (PROGRAM)**.

WINNING SCORES (Test n. 22, 23, 24 and 26). There are three scores, that can be programmed within a range from 0.00 through 9.990.000, respectively with tests 22, 23 and 24. The player or the players who exceed one or more (max. 3) winning scores, are awarded a prize as determined on test n. 26, for each exceeded winning score.

The scores programmed with 0,0 to are not enabled (they do not award any win even when test 26 is programmed for wins). The test n. 26 determines the type of win at each winning score limit, that can be chosen among:

- Test 26 = 00 = non win
- 01 = 1 bonus ball
- 02 = 1 replay
- 03 = 1 superbonus
- 04 = 500.000 points

For the programming of these tests it is necessary that SW n.4 is on **ON (PROGRAM)**, and then act on **CREDIT** push-button. For the scores (test 22, 23, 24) push repeatedly the **CREDIT** push-button to progress 1 by 1 (corresponding each to 10.000 points). When the button is kept pressed, the progress is fast.

00 = One can vary the number of functions required to light the special lamp.

- 00 = Difficult
- 01 = Medium difficulty
- 02 = Medium - easy
- 03 = Easy

For adjustment or changes, act on CREDIT button when SW 4 is ON (PROGRAM).

Test 27 determines the type of win to be awarded when the Special target is hit while corresponding lamp is lit.

- 00 = no win
- 01 = 1 bonus ball
- 02 = 1 replay
- 03 = 1 superbonus
- 04 = 1 000.000 points

For adjustment or changes, act on CREDIT button when SW 4 is ON (PROGRAM).

SPECIAL 2 ORANGE (Test 28, 34 and 35) It is possible, moreover, to tune the difficulty for obtaining lighting up of the "special" lamp, by modifying test n. 34.

- 00 = the lamp in front of the banks is extinguished
- 01 = the lamp in front of the banks is lit
- 02-03 = coupled lighting up of the special lamps

Test 35 determines whether the lamps on the mobile plate are lit one by one or two at a time.

- 00 = The lamps are extinguished one by one.
- 01 = Lamps are extinguished two at a time
- 02 = Like 01
- 03 = Like 01

For adjustment or changes, act on CREDIT button when SW 4 is ON (PROGRAM).

SOUND BACKGROUND (Test 29). If during the game a sound background is required, this test shall be programmed with 01, if not with 00. To program or modify, act on CREDIT push-button, provided SW 4 is in ON (PROGRAM) position.

COIN METER (Test n. 30). Same is an electromechanical impulse meter, to be connected with the circular 8-way connector located in the cabinet and that records the «UNIT VALUE» of the coins introduced into the 3 coin chutes.

It is never modified by the wins or the service games (obtained through the SERVICE push-button). The game can be played regularly both with connected and cut-off coin meter, if the test is programmed with 00. Note that the impulse meter is programmed with 00. Note that the impulse meter is always operating regardless of the type of programming used for test 30. To program or to change, act on CREDIT push-button, provided SW 4 is in ON (PROGRAM) position.

The impulse meter and the relevant wiring are available upon request.

GAME TIME BONUS (Test n. 31). After having used all the available balls (see test 20 + possible won balls), it is possible to get a game time extension that may range from a minimum of 10 seconds to a maximum of 99 seconds, determined by the play of the last normal ball. This time is indicated by 2 digits in the center of the HIGHEST SCORE TO DATE display (see figure 2). Upon play time expiry, all the controls are stopped, and thus the ball to play runs straight to the hole.

If the test has been programmed 00, the game is terminated normally (game time bonus excluded), while with 01 programming game time bonus is connected. To program or change, act on CREDIT push-button, provided SW 4 is in ON (PROGRAM) position.

GAME VARIATIONS ON TIME BRIDGE (Test 32). By this test the bonus multiplier value is determined.

- 00 = Lamps extinguished
- 01 = Lamps 30 000 lit
- 02 = Lamps lit
- 03 = Lamps lit

To program or change, act on CREDIT push-button, provided SW 4 is set on ON (PROGRAM).

GAME VARIATIONS ON STATIONARY TOP TARGETS (Test 35). By this test it is possible to determine whether the stationary top targets are extinguished one by one or two at a time.

- 00 = Extinguished one by one
- 01-02-03 = Extinguished two at a time

To program or change act on the CREDIT push-button, provided SW 4 is set on ON (PROGRAM).

SOUND AND TALK BOARD SELF TEST

With the pinball in GAME OVER condition, act on push-button located on the AUDIO board: the LED shall start blinking, and each blinking indicates the proper performance of a test, covering a total of 5 blinkings (5 tests).

The 1st blinking indicates that the RAM store inside the microprocessor is regularly operating.

The 2nd blinking indicates that PIA 1 (IC 15) that is to be used for the dialogue with the «generated sound» (AY 3-8910) is operating.

The 3rd blinking indicates that PIA 2 (IC 14) that serves for the dialogue with the «speech synthesizer» (TMS 5200) is operating.

The 4th blinking indicates that the «sound generator» (AY-3-8910) is operating.

The 5th blinking indicates that the «special synthesizer» is operating.

If everything operates properly, LID 1 is extinguished and remains in such conditions only after a certain number of sample phrases.

Keep in mind, that the completion of the SELF TEST does not mean at all that the AUDIO-board is correctly operating in all its parts, but it supplies a very good indication.

N. TEST	FUNCTION	N. FUNCTION IN TEST	DESCRIPTION
01	Test Display	1	1* All the displays show equal figures that follow each other 0,1,2...9,0 and so on. 2* By keeping the «CREDIT» push-button pressed, the displays show numbers in succession.
02	Contact test	88	Number of closed contact
03	Lamp test	1	All the piloted lamps are continuously lit and extinguished.
04	Solenoid test	88	The solenoids (from 1 through 24) are energized one after another. The figure indicates the energized solenoid. When it is operative it must be perceived.
05	Sound and talking test	88	Sounds and works are repeated one after another. The figure indicates the sound and the phrase being executed.

ACCOUNTING

N. TEST	FUNCTION	DESCRIPTION	HOW TO CLEAR
06	Duration	Player 1 display = Time of printable operation (minutes) Player 2 display = Game time (minutes) Player 3 display = Tilt number Player 4 display = Average game duration expressed in minutes	With SW4 ON (PROGRAM) push-button about 5 sec.
07	Takings	Player 1 display = Coins in coin chute 1 Player 2 display = Coins in coin chute 2 Player 3 display = Coins in coin chute 3 Player 4 display = SERVICE games	With SW4 ON act on CREDIT push-button abt. 5 sec.
08	Wins	Player 1 display = Games played in total Player 2 display = Won games Player 3 display = Won balls Player 4 display = Won superbonus	With SW4 ON act on CREDIT push-button for abt. 5 sec.
09	Wins	Player 1 display = H.S. is exceeded Player 2 display = Winning scores are exceeded Player 3 display = Special 1 Player 4 display = Special 2	With SW4 in ON act for about 5 seconds on CREDIT button.

PROGRAMMING

N. TEST	FUNCTION	PROGRAMMED VALUE	DESCRIPTION	DATA FOR THE PROGRAMMER
10	High-Score types	00 01	NORMAL H.S. or max. scores achieved by one player. RANDOM H.S. or casual scores that may change at the beginning of each game.	With SW4 on ON act on CREDIT push-button.
11	Coin value 1st coin chute	from 01 to 10	Value of the coins for the 1st coin chute (at the left side close to the hinge).	With SW4 on ON act on CREDIT push-button.
12	Coin credits 1st coin chute	from 00 to 15	Credits per each single coin introduced into the first coin chute.	
13	Coin value 2nd coin chute	from 01 to 10	Value of the coins for the 2nd coin chute (at the right side, close to the key).	
14	Coin credits 2nd coin chute	from 00 to 15	Credits per each single coin introduced into the second coin chute.	
15	Coin value 3rd coin chute	from 01 to 10	Value of the coin for the 3rd coin chute (in the center).	
16	Coins credit 3rd coin chute	from 00 to 15	Credits per each single coin introduced into the third coin chute.	
17	High-Score initial value	from 0.00 to 9.99	When test 10 is programmed with 00, initial NORMAL H.S. is programmed. If test 10 is programmed 01, the min. RANDOM H.S. is programmed.	

Segue: PROGRAMMING

N. TEST	FUNCTION	VALUE PROGRAMMED	DESCRIPTION	DATA FOR THE PROGRAMMER
18	Not used			
19	Max credits	from 10 to 30	Max number of credits beyond which coin chutes are locked, and no won games are attributed anymore	Act on CREDIT push-button with SW4 on ON
20	Balls	from 01 to 07	Balls per play	Act on CREDIT push button with SW 4 on ON
21	MATCH	00 01	Match excluded (no wins) Match connected (1 Replay)	Act on CREDIT push-button with SW4 on ON
22	1st winning scores	from 0.00 to 9.99	1st winning score, which awards the win programmed on test n.26 when exceeded. 0.00 = no win	With SW4 on ON act stepwise on CREDIT push-button for slow progress. For fast progress keep it pressed
23	2nd winning scores	from 0.00 to 9.99	2nd winning score which awards the win programmed on test n. 26 when exceeded. 0.00 = no win	
24	3rd winning scores	from 0.00 to 9.99	3rd winning score which awards the win programmed on test n.26 when exceeded. 0.00 = no win.	
25	Wins with HIGHEST SCORE	00 01 02 03 04	No win 1 Replay 2 Replay 3 Replay 1 Superbonus	With SW4 on ON act on CREDIT push-button

37	Not used			

IMPORTANT: With SW4 in ON (PROGRAM) position, the pinball cannot enter a game, even though there may be credits available, and the machine is in GAME OVER condition. A buzzer and the blinking of the TILT lamp indicate anomalous condition.

TROUBLE SHOOTING

CONDITION	CAUSE	REMEDY	NOTES
The game cannot be started	<ul style="list-style-type: none"> - No voltage available - Plug is off - The 3-way connector (CN-line-) of the feeder rack is not connected - Mains fuse burned - The 9-way connector (CN-Ja-) on the feeder rack disconnected - Mains switch open - Connector (CN 1) on feeder and connectors (CN-J1-J2-J3-) on feeder rack disconnected - Voltage change over not or insufficiently connected 	<ul style="list-style-type: none"> - Plug in Connect Replace Replace Close Connect Correct 	<p>If they burn again, this means that there is a short circuit</p> <p>The voltage change over unit contains also the mains fuse</p>
All stationary lamps are not lit	<ul style="list-style-type: none"> - Fuse F2 on the feeder rack thrown out - CN J1-J2-J3 connector not connected - Electric wire disconnected 	<ul style="list-style-type: none"> Replace Plug in Connect 	Shall not be more than 20A; if it is thrown out again there is a short-circuit
All the piloted lamps are not operating	<ul style="list-style-type: none"> - 5 VRM is not available - The connector between C.P.U. and the interface is disconnected - Interface (CN 16) feeding connector is not plugged in - The connectors of the lamps on Interface (CN 18-19-20-21-22) are not connected - The connectors at the feeder board output are disconnected (CN 2-3-4) - At the C.P.U. input and at the interface 5,6 V d.c. are missing - C.P.U. is always cleared - Others 	<ul style="list-style-type: none"> Fuse F3 (15A) on Power-board is burned Tighten the loose connectors Fuse F2 (5A) is burned and shall therefore be replaced. If it is thrown out again, there is a short circuit. Replace feeder board. Replace feeder and then replace C.P.U. Replace interface 	Test carefully with tester
All displays are extinguished.	<ul style="list-style-type: none"> - + 170 V d.c. is missing because fuse F1 (1A) is burned. Or high voltage regulator is damaged. Or high voltage regulator safety circuit is actuated. - At C.P.U. -input +5.6 V is missing - CN 14 or all connectors of displays are disconnected - Display damaged - C.P.U. damaged 	<ul style="list-style-type: none"> Replace the fuse. Check with the tester whether the high-voltage feeder operates. When safety device is actuated, try to disconnect the displays. If the feeder operates at 170 V this means that on the displays there exists a short circuit. To restore +170 V it is necessary to stop the pinball and then to start it again Check and if necessary replace the F2 (5A) fuse on the feeder board Plug in connectors 	
On all the displays wrong figures are appearing	<ul style="list-style-type: none"> - Cable damaged - C.P.U. damaged 	<ul style="list-style-type: none"> Replace the cable Replace C.P.U. 	
One or more figures on one or more displays are wrong.	<ul style="list-style-type: none"> - Display damaged - Cable damaged 		
All figures are too bright	<ul style="list-style-type: none"> - +170 V feeder damaged 	Replace the feeder board	
All the solenoids do not work	<ul style="list-style-type: none"> - 39 VRM input is missing - CN 17 connector is not plugged in - Interface damaged - C.P.U. damaged 	<ul style="list-style-type: none"> Reset the fuse If it is thrown out again there is a short circuit Plug in the connector Replace the Interface Replace the C.P.U. 	
One or more solenoids do not work	<ul style="list-style-type: none"> - Coils burned - Darlington burned - Electric wires loose - The fuses under the playfield have been thrown out 	<ul style="list-style-type: none"> Replace coil and the relevant Darlington Replace the Darlington and check the diode on the coil. Connect the loose wires Reset the burned out fuses 	
One or more solenoids are always energized	<ul style="list-style-type: none"> - Interface-board damaged - C.P.U. damaged - Short circuit 	<ul style="list-style-type: none"> Replace the Interface-board Replace the C.P.U. board 	
All the contacts remain inactive	<ul style="list-style-type: none"> - CN 10-11 connectors are loose - C.P.U. is damaged 	<ul style="list-style-type: none"> Plug in Replace C.P.U.-board 	

CONDITION	CAUSE	REMEDY	NOTES
One or more contacts do not work	<ul style="list-style-type: none"> - Loose wires - Interrupted or loose - Contact oxydized 	Connect all the loose wires Reset the diode Clean the contact	
One or more contacts are wrongly read	<ul style="list-style-type: none"> - The contact wires are short circuited and also with respect to the lamp and solenoid wires - Diode contacts are short circuited - C.P.U. is damaged 	Eliminate the short circuit Replace the short circuited diode Replace C.P.U.	
All sounds and words are missing	<ul style="list-style-type: none"> - The loudspeaker is not connected or damaged - Loudspeaker potentiometer cut off - CN 6 connector (Sound board) disconnected - 5 V d.c. feeding voltage is missing - +12 V d.c. feeding voltage missing - +5 V d.c. feeding voltage missing - Sound and talk board damaged 	Connect, if necessary replace Replace another one having similar features Plug in the connector Replace fuse F4 (1A) on the feed board, if burned Replace fuse F2 (5A) on the feed board, if burned If +5 V d.c. are missing, but +12 V d.c. are available, replace the regulator 78H05 Replace the sound and talk board	

VERY IMPORTANT. Never connect or disconnected the connectors while the game is running

The game is supplied with a special plug to connect a print-out unit that is very useful to print on paper all the most important accounting functions, as well as the serial number of the game.
 Hereafter a fac-simile print out.
 The same plug is to be used also for the coin meter.

REGOLAZIONI GRUPPO ASCENSORE

- 1) Livellamento piano mobile
 - a) portare a battuta sul piano le piastrelle di livellamento (a)
 - b) portare a fine corsa superiore la carrina del motorino mediante il micro (b)
 - c) allentare il dado (c) fino a non avere pressione sul dado stesso
 - d) portare a 1 mm. lo spazio tra il dado (c) e la staffa (d)
 - e) avvitare forte il dado (c) e controllare il parallelismo dell'asta (f) con la parete dell'assa
- f) fare compiere alcuni movimenti al piano mobile e controllare che la pressione sulla piastrella (a) non sia eccessiva
- 2) Livellamento pleoglass
 - a) portare la carrina del motorino a fine corsa inferiore mediante il micro (b)
 - b) livellare il pleoglass mediante le viti (g) svitando i dadi delle viti stesse
 - c) bloccare di nuovo il dado a operazione terminata

MOVING BUMPER ASSEMBLY ADJUSTMENT

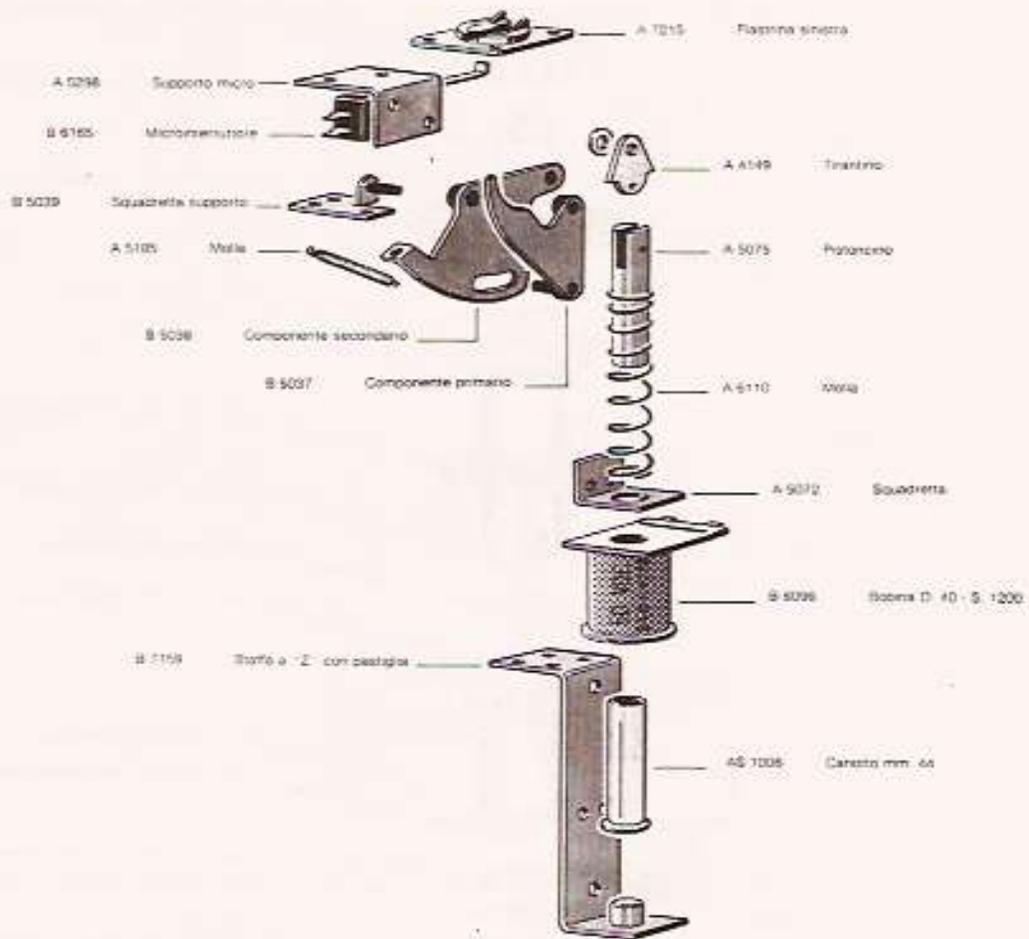

- 1) Moving assembly leveling
 - a) Make leveling plates (a) contact playfield
 - b) Lead motor cam to upper stop point by micro (b)
 - c) Loosen nut (c) until no pressure is exerted on the nut itself
 - d) Make distance between nut (c) and Z bracket (d) equal to 1 mm.
 - e) Tighten nut (c) as much as possible and make sure about parallelism between rod (f) and slot wall.
- f) Make moving assembly accomplish some rising and falling movements and make sure that pressure exerted on plate (a) is not excessive.
- 2) Plexiglass leveling
 - a) Lead motor cam to lower stop point by micro (b)
 - b) By screws (g), level plexiglass by screwing out nuts of the same screws.
 - c) After that, retighten nuts.

REGLAGE DU GROUPE MONTANT

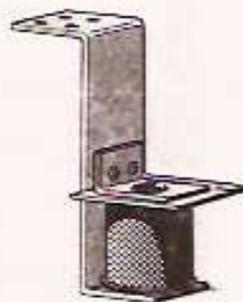

- 1) Nivellement du plateau mobile
 - a) Porter les plaques de nivellement (a) jusqu'à toucher le plateau du jeu.
 - b) Porter la came du petit moteur juste au point d'arrêt supérieur par le micro (b).
 - c) Desserrer le dé (c) jusqu'à ce que aucune pression ne soit exercée sur le dé même.
 - d) Rendre la distance entre le dé (c) et l'étrier à Z (d) égale à 1 mm.
 - e) Serrer le dé (c) bien étroit et contrôler le parallélisme entre la tige (f) et la paroi du trou.
- f) Faire accomplir quelques mouvements au plateau mobile et s'assurer que la pression sur le plateau (a) ne soit pas trop élevée.
- 2) Nivellement du pleoglass
 - a) Porter la came du petit moteur juste au point d'arrêt inférieur au moyen du micro (b).
 - b) Nivelier le pleoglass au moyen des vis (g) en desserrant les écrous des vis mêmes.
 - c) Après cette opération, bloquer les écrous à nouveau.

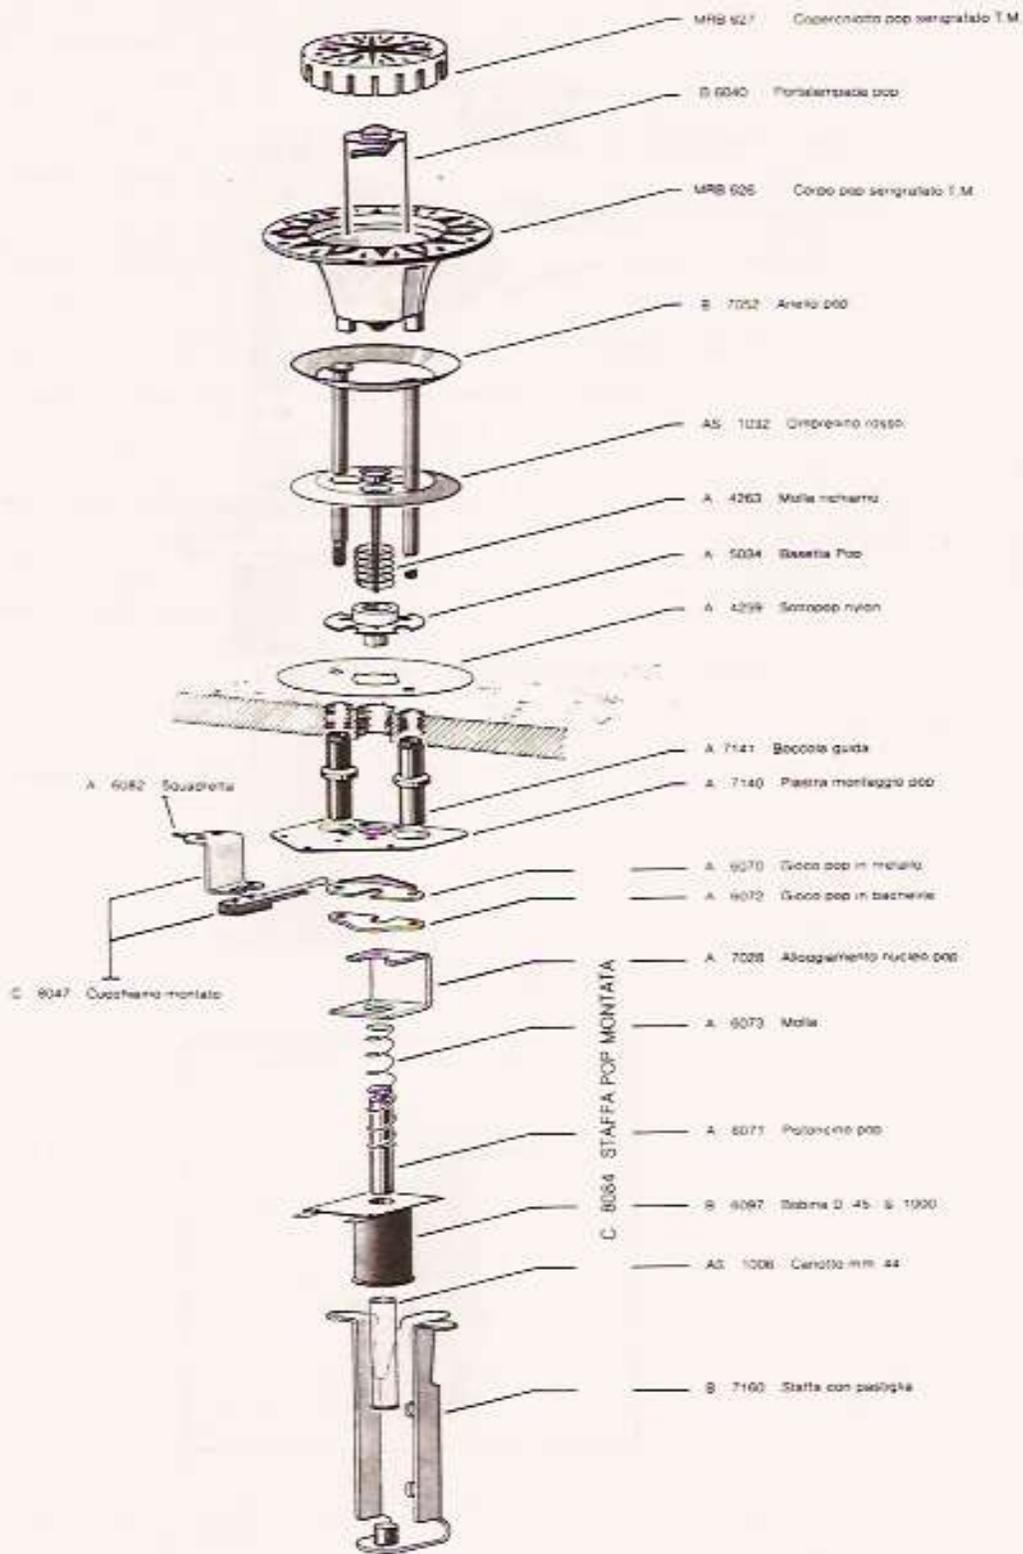

EINSTELLUNG DER AUFZUGSGRUPPE

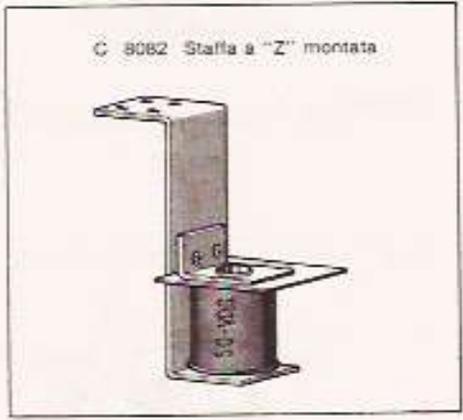

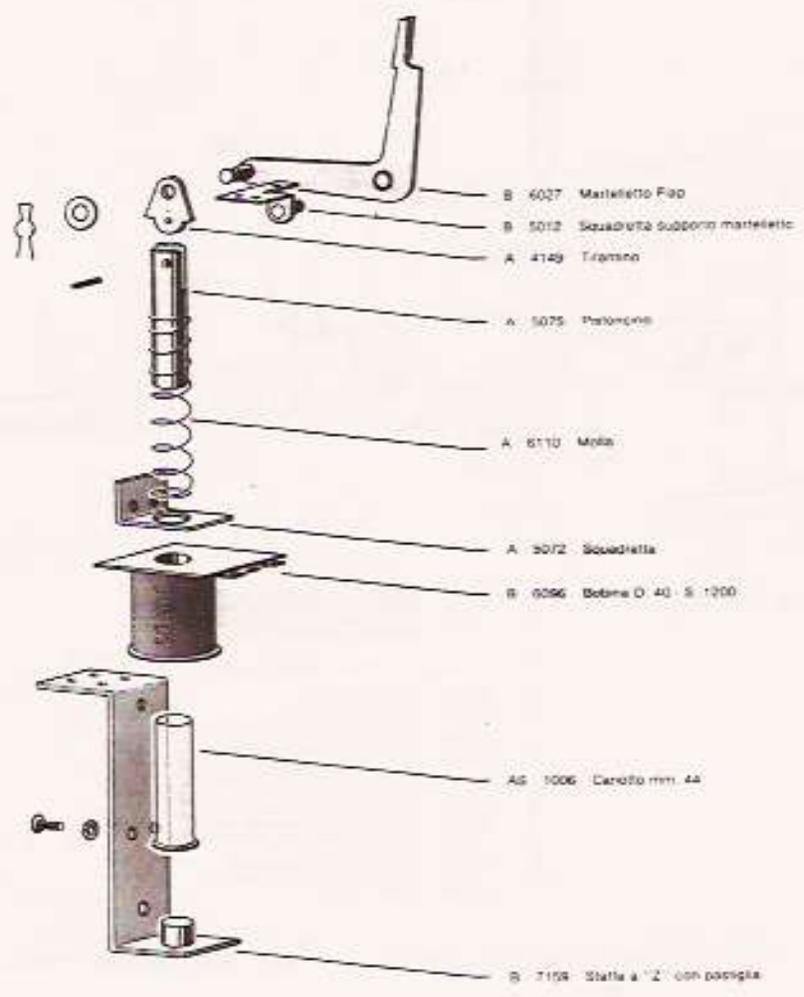

- 1) Horizontale Ausrichtung der beweglichen Platte
 - a) Man lege die Auslöseventile (a) auf die Platte auf.
 - b) Man bringe die Kurven des Elektromotors mittels des Mikroschalters in die Position der oberen Anlage.
 - c) Man löse die Mutter (c), bis dieser keinerlei Druck mehr unterworfen ist.
 - d) Man reguliere den Abstand zwischen der Mutter (c) und der Halterung (d) auf 1 mm ein.
 - e) Man achte auf die Mutter (c) hin zu, und kontrolliere, ob die Stange (f) perfekt parallel ist mit der Wand des Schlittens.
 - f) Man führe einige Bewegungen der beweglichen Platte aus, und kontrolliere, ob kein zu starker Druck auf die Plättchen (a) ausgeübt wird.
- 2) Positionierung des Plexiglasses
 - a) Man bringe die Kurven des Elektromotors mittels des Mikroschalters (b) in die untere Anlage.
 - b) Man richte das Plexiglas mittels der Schrauben (g) aus indem man die Muttern der Schrauben selbst aufschraubt.
 - c) Man schraube die Muttern nach Beendigung dieser Maßnahme wieder fest.
